

## KRAIBURG profiKURA 3D leveling mat

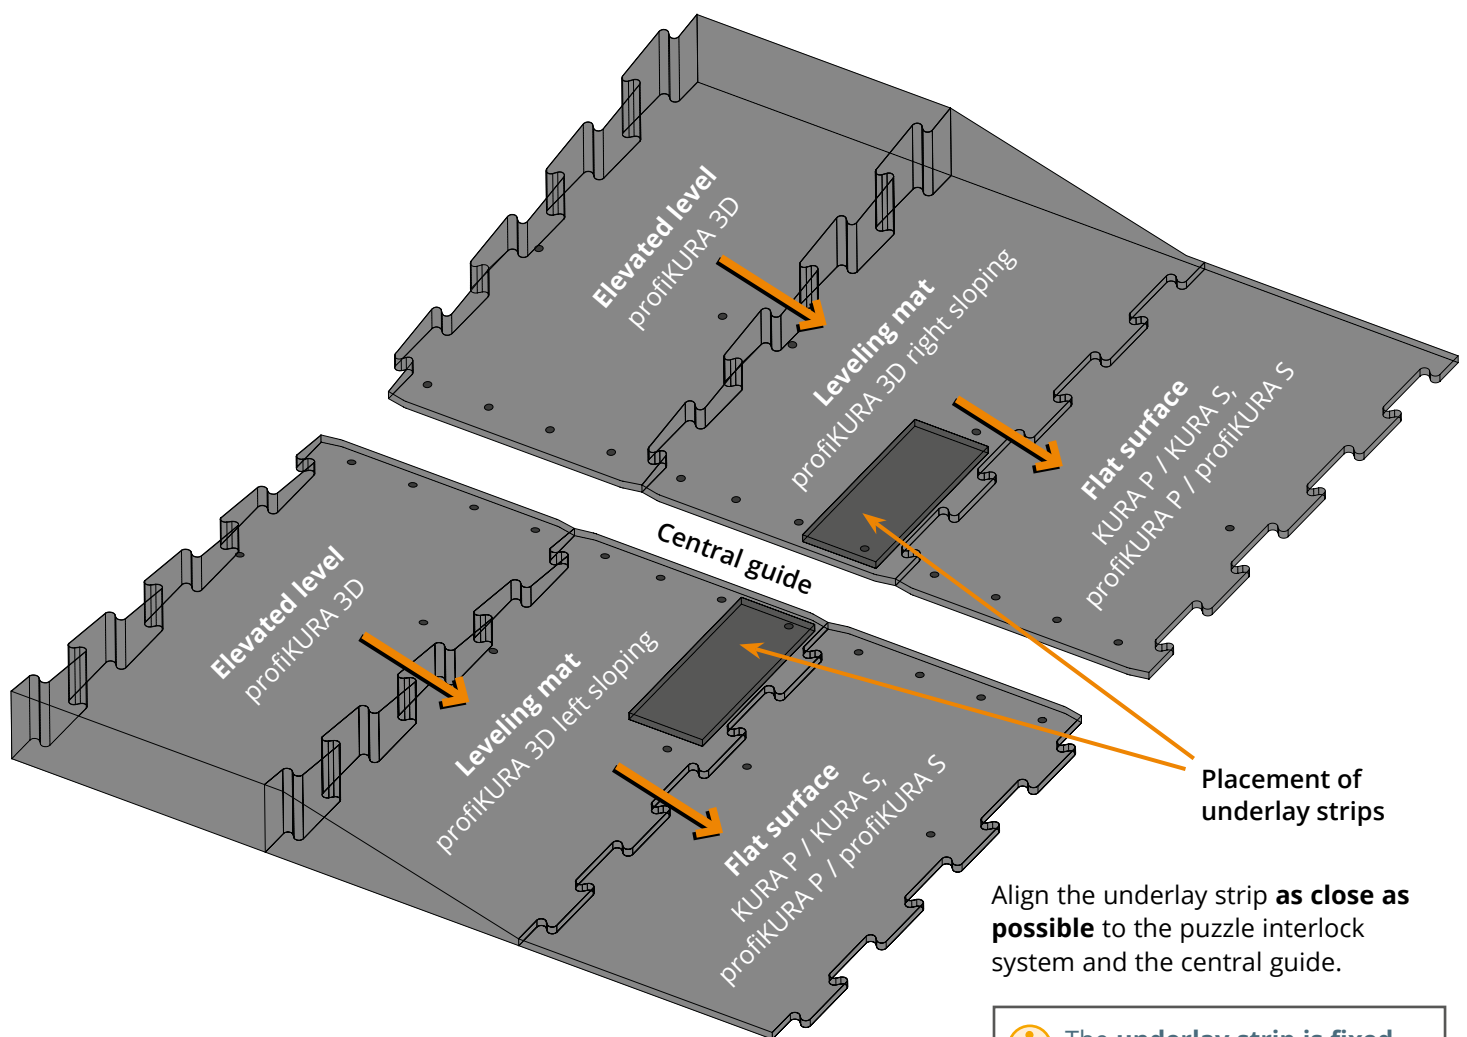

### For leveling out differences in height

The "profiKURA 3D left sloping" and "profiKURA 3D right sloping" leveling mats are required for transitioning from a flat surface (KURA P / KURA S, profiKURA P / profiKURA S) to an elevated level (profiKURA 3D).

Differences in height may be present, e.g.:

- in front of the milking robot
- in front of the drainshaft
- between the walking alley and the crossing passage / alley
- etc.

### How to combine and install the "profiKURA 3D left sloping" and "profiKURA 3D right sloping" leveling mats:

Align the underlay strip **as close as possible** to the puzzle interlock system and the central guide.

 The **underlay strip is fixed** in place when attaching the mats.

 **To ensure the scraper slides reliably across the puzzle interlock section, an underlay strip (20 x 10 cm) must be placed beneath the leveling mat to adjust the precise height.**  
**→ For exact positioning, see illustration above**  
 (underlay strips are part of the delivery)

 **To overcome slope differences, the scraper must have flexibly mounted scraper side arms.**

## Installation prerequisites, install, adapt and fix the mats:

→ See installation instructions for profiKURA 3D
